Japanese Patent Kokai JP-!-M6-136400 teaches a leather laminate in which a plastic film is laminated onto the surface of natural leather material. The plastic film may be made of vinyl leather or as a urethane sheet. The lamination of the plastic film makes the natural leather material more durable. The patent application discloses that the lamination is carried out by means of an adhesive or press bonding with heat. The patent application does not disclose the extent that the leather laminate is permeable to water vapour nor does it teach the details of the lamination process
